# 1. COMMUNICATION FUNCTIONS

---

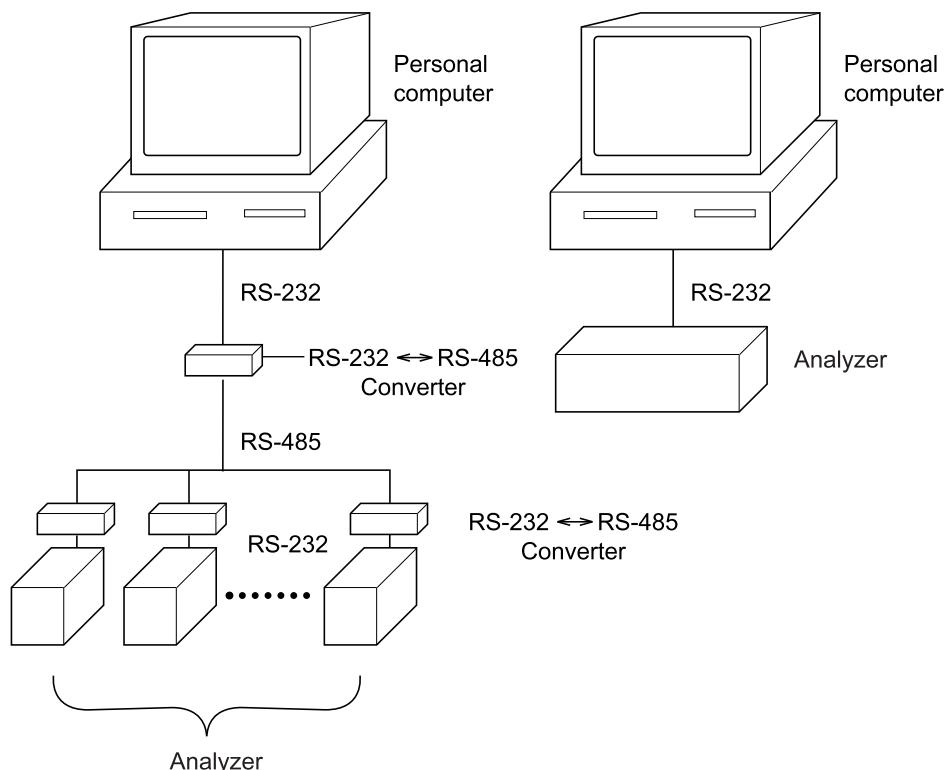

## 1.1 General

- This instrument provides a communication function through RS-232 interface, which allows data transmit to or receive from the host computer and other devices.
- The communication system is comprised of a master station and slave stations. One slave station (this instrument) can be connected to one master station.  
It is also possible to adapt the instrument to the environment of RS-485 interface using RS-232C ↔ RS-485 converter. In this case, up to 31 of slave station (present instrument) can be connected per master station.
- Because the master station can communicate with only one slave station at a time, the destination can be identified by the "Station No" set for each slave station.
- In order that the master station and the slave station can communicate, the format of the transmit/receive data must coincide. In this instrument, the format of the communication data is determined by the MODBUS protocol.

[RS-232 ↔ RS-485 converter] (recommended article)

Type: KS-485 (non-isolated type)/SYSTEM SACOM Corp.

Type: SI-30A (isolated type)/SEKISUI ELECTRONICS Co., Ltd.

## **2. SPECIFICATIONS**

---

### **2.1 Communication specifications**

Item	Specification	
Electrical specification	Based on EIA RS-232C	
Transmission system	2-wire, semi-duplicate	
Synchronizing system	Start-stop synchronous system	
Connection format	1 : 1	
Number connectable units	1 unit (or 31 if RS-485 interface is used)	
Transmission speed	9600bps	
Data format	Data length	8 bits
	Stop bit	1 bit
	Parity	None
	X flow control	None
Transmission code	HEX value (MODBUS RTU mode)	
Error detection	CRC-16	
Isolation	No isolation between transmission circuit and others	

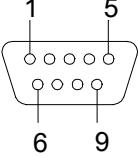

### 3. CONNECTION

#### WARNING

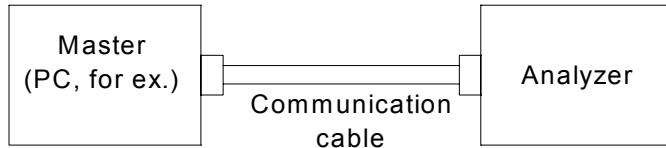

For avoiding electric shock and malfunctions, do not turn on the power supply until all wiring have been completed.

#### 3.1 Terminal allocation (Input/output terminal CN12)

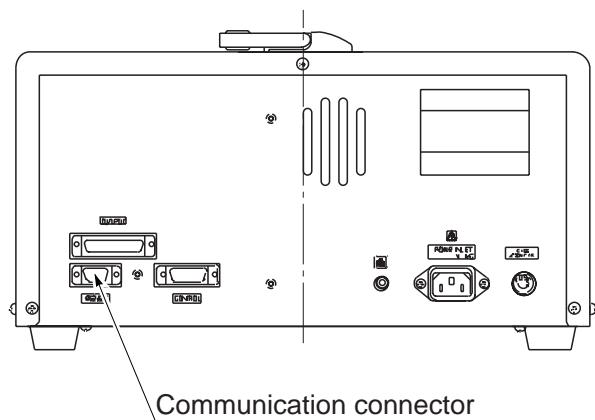

Terminal number	Signal name	Pin connection
2	Receive Data	 9-pin D-Sub (male)
3	Transmit Data	
5	Signal GND	
Others	NC	

#### 3.2 Connection

As connecting cable, use a commercially available RS-232 reverse cable.

<Rear view>

## **4. SETTING OF COMMUNICATION CONDITION**

---

In order that the master station and instrument can correctly communicate, following settings are required.

- All communication condition settings of the master station are the same as those of instruments.
- All instruments connected on a line are set to "Station Nos. (STno)" which are different from each other.  
(Any "Station No." is not shared by more than one instrument.)

### **4.1 Set items**

The parameters to be set are shown in the following table. Set them by operating the front panel keys.

Item	Value at delivery	Setting range	Remarks
Transmission speed	9600bps	Fixed (can not be changed)	Set the same communication condition to the master station and all slave stations.
Data length	8 bits	Fixed (can not be changed)	
Stop bit	1 bit	Fixed (can not be changed)	
Parity setting	None	Fixed (can not be changed)	
Station No.	1	0 to 31 (0: Communication function stop)	Set a different value to each station.

### **4.2 Setting operation**

Set the station No. on the analyzer maintenance mode display (see the instruction manual).

## 5. MODBUS COMMUNICATION PROTOCOL

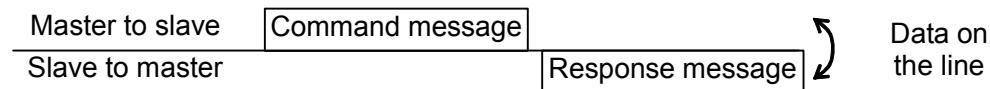

---

### 5.1 General

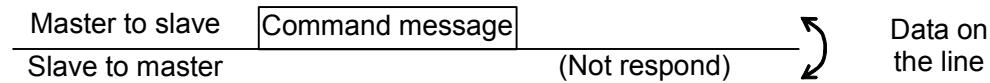

The communication system by the MODBUS protocol is that the communication is always started from the master station and a slave station responds to the received message.

Transmission procedures is as shown below.

- 1) The master station sends a command message to a slave station.
- 2) The slave station checks that the station No. in the received message matches with the own station No. or not.
- 3) If matched, the slave station executes the command and sends back the response message.
- 4) If mismatched, the slave station leaves the command message and wait for the next command message.
  - a) In case when the station No. in the received command message matches with the own slave station No.

- b) In case when the station No. in the received command message mismatches with the own slave station No.

The master station can individually communicate with any one of slave stations connected on the same line upon setting the station No. in the command message.

## 5.2 Composition of message

Command message and response message consist of 4 fields ; Station No., Function code, Data and Error check code. And these are sent in this order.

Station No. (1 byte)
Function code (1 byte)
Data (2 to 133 bytes)
Error check code (CRC-16) (2 bytes)

**Fig. 5-1 Composition of message**

In the following, each field is explained.

### (1) Station No.

Station No. is the number specifying a slave station. Only a slave station that corresponds to a value to which "Station No." is set on the analyzer maintenance mode display executes a command.

### (2) Function code

This is a code to designate the function executed at a slave station.  
For details, refer to section 5.4.

### (3) Data

Data are the data required for executing function codes. The composition of data varies with function codes. For details, refer to chapter 6.

A register number is assigned to each data in the analyzer. For reading/writing the data by communication, designate the register number.

Note that the register number transmitted on message is expressed as its relative address.  
The relative address is calculated by the following expression.

$$\text{Relative address} = (\text{The lower 4 digit of the } \boxed{\text{Coil number or Register number}}) - 1$$

For example, when the register number designated by a function code is 40003,

$$\begin{aligned}\text{Relative address} &= (\text{lower 4 digits of 40003}) - 1 \\ &= 0002\end{aligned}$$

is used on the message.

---

#### **(4) Error check code**

This is the code to detect message errors (change in bit) in the signal transmission.  
On the MODBUS protocol (RTU mode), CRC-16 (Cyclic Redundancy Check) is applied.

For CRC calculation method, refer to section 5.5.

## 5.3 Response of slave station

### (1) Response for normal command

To a relevant message, the slave station creates and sends back a response message which corresponds to the command message. The composition of message in this case is the same as in section 5.2.

Contents of the data field depend on the function code. For details, refer to Chapter 6.

### (2) Response for abnormal command

If contents of a command message have an abnormality (for example, non-actual function code is designated) other than transmission error, the slave station does not execute that command but creates and sends back a response message at error detection.

The composition of response message at error detection is as shown in Fig. 5-2. The value used for function code field is function code of command message plus  $80_H$ .

Table 5-1 gives error codes.

Station No.
Function code + $80_H$
Error code
Error check (CRC-16)

Fig. 5-2 Response message at error detection

Table 5-1 Error code

Error code	Contents	Description
01H	Function code error	Non-actual function code is designated. Check for the function code.
02H	Address error for coil or register	A relative address that cannot be used with the specified function code is specified for the coil No. or the register No.
03H	Coil or register quantity error	Because the designation of number is too much, the area where register numbers do not exist is designated.

### (3) No response

Under any of the following items, the slave station takes no action of the command message and sends back no response.

- A station number transmitted in the command message differs from the station number specified to the slave station.
- A error check code is not matched, or a transmission error (parity error, etc.) is detected.
- The time interval between the composition data of the message becomes longer than the time corresponding to 24 bits. (Refer to section 5.6 Transmission control procedure)

## 5.4 Function code

According to MODBUS protocol, register numbers are assigned by function codes.

Each function code acts on specific register number.

This correspondence is shown in Table 5-2, and the message length by function is shown in Table 5-3.

**Table 5-2 Correspondence between function codes and objective address**

Function code			Register No.	
No.	Function	Object	No.	Contents
03 <sub>H</sub>	Read-out (continuously)	Holding register	4xxxx	Read-out/write-in word data
04 <sub>H</sub>	Read-out (continuously)	Input register	3xxxx	Read-out word data
06 <sub>H</sub>	Write-in	Holding register	4xxxx	Read-out/write-in word data
10 <sub>H</sub>	Write-in (continuously)	Holding register	4xxxx	Read-out/write-in word data

**Table 5-3 Function code and message length**

[Unit : byte]

Function code	Contents	Number of designatable data	Command message		Response message	
			Minimum	Maximum	Minimum	Maximum
03 <sub>H</sub>	Read-out of word data	64 words	8	8	7	133
04 <sub>H</sub>	Read-out of word data (read-out only)	64 words	8	8	7	133
06 <sub>H</sub>	Write-in of word data	1 word	8	8	8	8
10 <sub>H</sub>	Write-in of continuous word data	64 words	11	137	8	8

## 5.5 Calculation of error check code (CRC-16)

CRC-16 is the 2-byte (16-bits) error check code. From the top of the message (station No.) to the end of the data field are calculated.

The slave station calculates the CRC of the received message, and does not respond if the calculated CRC is different from the contents of the received CRC code.

The following shows the calculation procedure for CRC-16.

- (a) Store FFFFH into 16 bit register (CRC register).
- (b) Subject the 1st byte (8 bits) of transmit message and CRC register contents to an exclusive logical summation (XOR), and store the result into the CRC register.
- (c) Shift the CRC register contents 1 bit to the right. Store 0 at MSB.
- (d) If LSB before shifting is 0, do nothing.  
If LSB before shifting is 1, subject it and A001H to XOR, and store the result into the CRC register.
- (e) Repeat the steps (c) and (d) 8 times (shift by 8 bits).
- (f) Execute steps (b) to (e) for the next byte of the transmit message.  
Likewise, successively repeat the steps to each byte of the transmit message.
- (g) The CRC code that is retained is the value of CRC register that stands when the processing has ended for latest byte (latest data except error code) of the transmit message.
- (h) As error check code of the transmit message, store this CRC value in the order of lower 8 bits and upper 8 bits.

Transmit message (ex.)

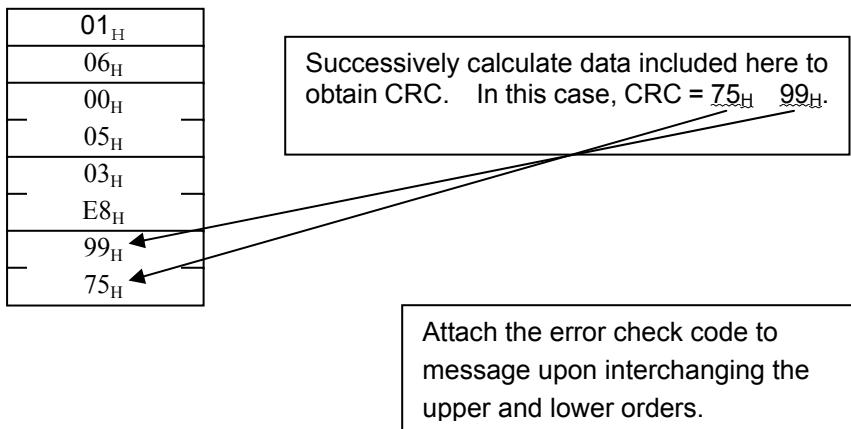

Figure 5-3 on the next page shows the flow of the CRC-16 calculation system.

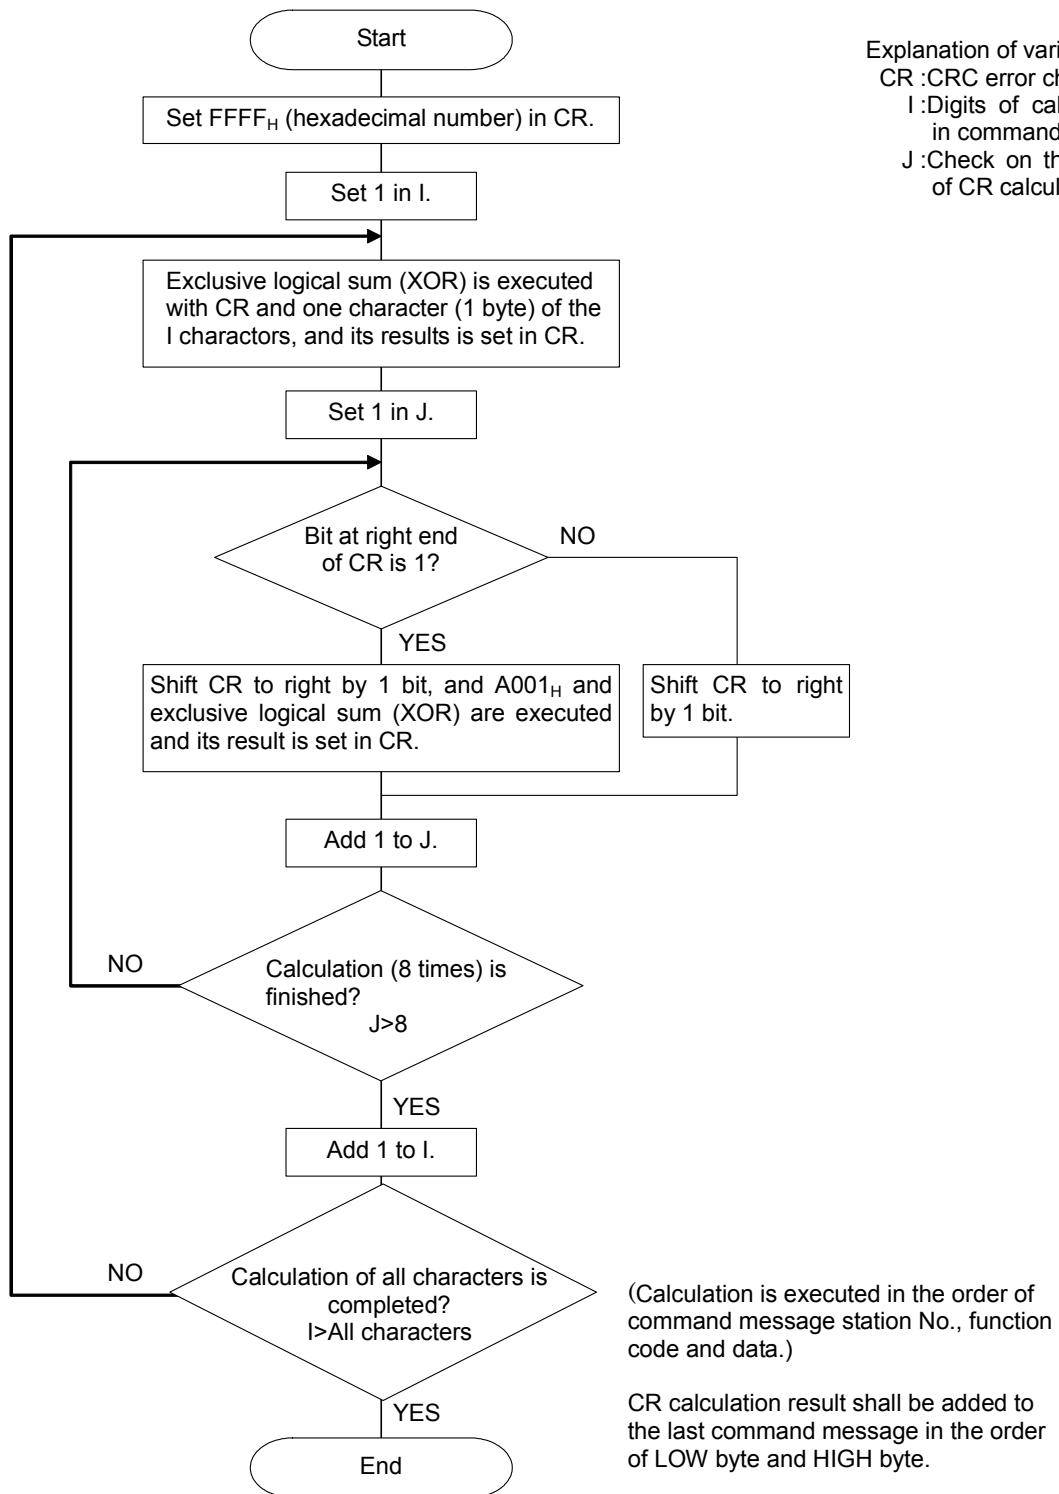

Fig. 5-3 Flow of CRC-16 calculation

## 5.6 Transmission control procedure

### (1) Transmission procedure of master station

The master station must proceed to a communication upon conforming to the following items.

- (1-1) Before sending a command message, provide 48 bits time or more vacant status.
- (1-2) For sending, the interval between bytes of a command message is below 24 bits time.
- (1-3) Within 24 bits time after sending a command message, the receiving status is posted.
- (1-4) Provide 48 bits time or more vacant status between the end of response message reception and beginning of next command message sending [same as in (1-1)].
- (1-5) For ensuring the safety, make a confirmation of the response message and make an arrangement so as to provide 3 times or more retries in case of no response, error occurrence, etc.

Note) The values in the above definition are for marginal communications. For ensuring the safety, it's recommended the program of the master to work with safety factors of 2 to 3. Concretely, it is advised to arrange the program for 9600 bps with 10 ms or more for vacant status (1-1), and within 1 ms for byte interval (1-2) and changeover from sending to receiving (1-3).

### (2) Description

#### 1) Detection of the message frame

The status on the line of the communication system is one of the 2 below.

- (a) Vacant status (no data on line)
- (b) Communication status (data is existing)

Instruments connected on the line are initially at a receiving status and monitoring the line. When 24 bits time or more vacant status has appeared on the line, the end of preceding frame is assumed and, within following 24 bits time, a receiving status is posted. When data appears on the line, instruments receive it while 24 bits time or more vacant status is detected again, and the end of that frame is assumed. I.e., data which appeared on the line from the first 24 bits time or more vacant status to the next 24 bits time or more vacant status is fetched as one frame.

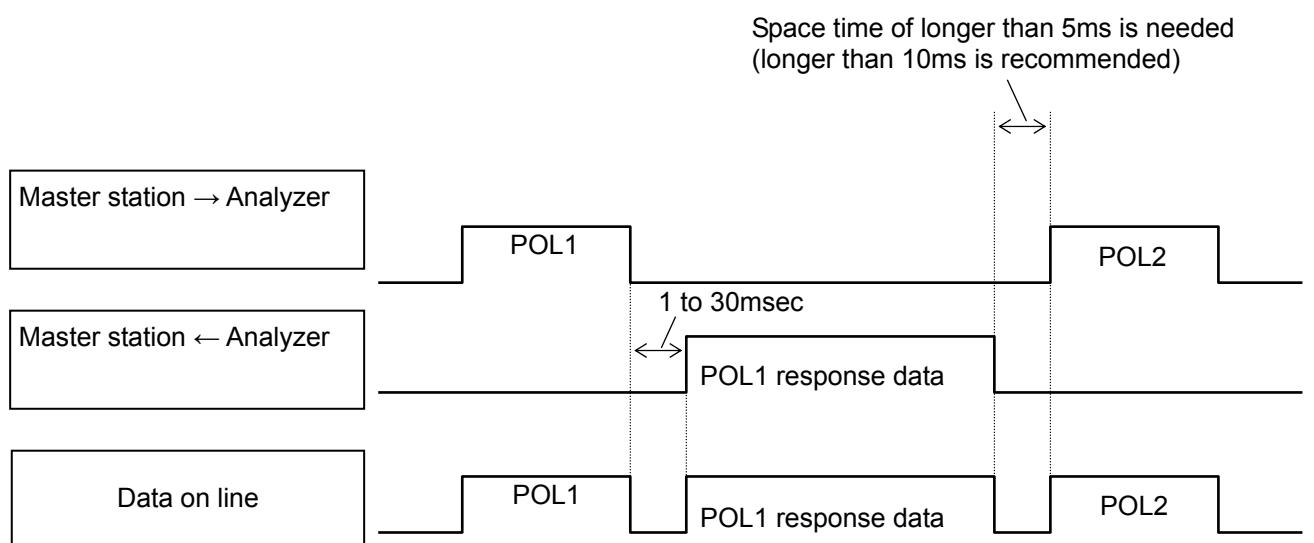

Therefore, one frame (command message) must be sent upon confirming the following.

- (1-1) 48 bits time or more vacant status precedes before the command message sending.
- (1-2) Interval between bytes of 1 command message is smaller than 24 bits time.

#### 2) Response of this instrument

After a frame detection (24 bits time or more vacant status), this instrument carries out processing with that frame as a command message. If the command message is destined to the own station, a response message is returned. Its processing time is 1 to 30 ms (depends on contents of command message). After sending a command message, therefore, the master station must observe the following.

- (1-3) Receiving status is posted within 24 bits time after sending a command message.

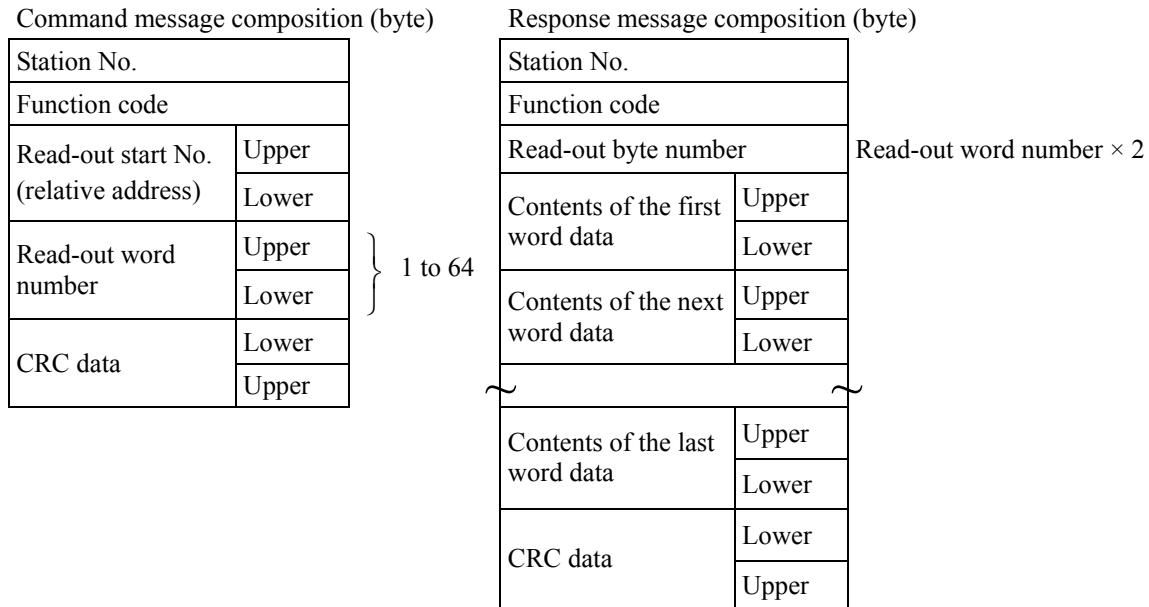

## 6. DETAILS OF MESSAGE

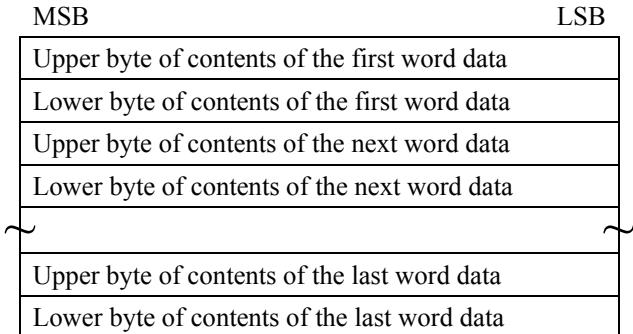

### 6.1 Read-out of word data [Function code:03<sub>H</sub>]

Function code	Max. word number read-out in one message	Relative data address	Register No.
03 <sub>H</sub>	64 words	0000 <sub>H</sub> —004C <sub>H</sub>	40001—40077

#### (1) Message composition

\* Arrangement of read-out word data

#### (2) Function explanations

Word data of continuous word numbers from the read-out start No. can be read. Read-out word data are transmitted from the slave station in the order of upper and lower bytes.

---

### (3) Message transmission (example)

The following shows an example of reading out from No. 1 station the setting CH1 (1st component) range-3 zero and span calibration concentration.

Relative address of CH1 range-3 zero calibration concentration setting: 0004<sub>H</sub>

Data number: 02<sub>H</sub>

Command message composition (byte)

Station No.	01 <sub>H</sub>	
Function code	03 <sub>H</sub>	
Read-out start No. (relative address)	Upper	00 <sub>H</sub>
	Lower	04 <sub>H</sub>
Read-out word number	Upper	00 <sub>H</sub>
	Lower	02 <sub>H</sub>
CRC data	Lower	85 <sub>H</sub>
	Upper	CA <sub>H</sub>

Response message composition (byte)

Station No.	01 <sub>H</sub>	
Function code	03 <sub>H</sub>	
Read-out byte number	04 <sub>H</sub>	
Contents of the first word data	Upper	00 <sub>H</sub>
	Lower	00 <sub>H</sub>
Contents of the next word data	Upper	03 <sub>H</sub>
	Lower	E8 <sub>H</sub>
CRC data	Lower	FA <sub>H</sub>
	Upper	8D <sub>H</sub>

\* Meaning of read-out data

CH1 range-3 zero calibration concentration setting  
(contents of first word data)

00 00<sub>H</sub> = 0

CH1 range-3 span calibration concentration setting  
(contents of next word data)

03 E8<sub>H</sub> = 1000

Provided decimal point position = 0, measurement unit = 1,

Lower limit of concentration setting = 0 ppm

Higher limit of concentration setting = 1000 ppm

For handling of decimal point and unit, refer to Section 7.1.

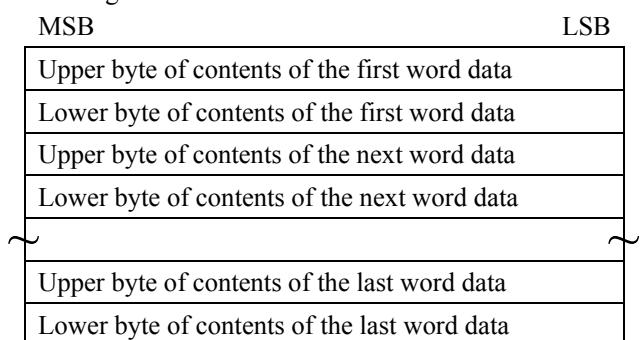

## 6.2 Read-out of read only word data [Function code:04H]

Function code	Max. word number read-out in one message	Relative data address	Register No.	Contents
04 <sub>H</sub>	64 words	0000 <sub>H</sub> –00B7 <sub>H</sub>	30001–30184	Measurement value and status
		03E8 <sub>H</sub> –0441 <sub>H</sub>	31001–31090	Fixed setting

## (1) Message composition

Command message composition (byte)		Response message composition (byte)	
Station No.		Station No.	
Function code		Function code	
Read-out start No. (relative address)	Upper	Read-out byte number	Read-out word number × 2
	Lower	Contents of the first word data	Upper
Read-out word number	Upper		Lower
	Lower	Contents of the next word data	Upper
CRC data	Lower		Lower
	Upper	Contents of the last word data	Upper
			Lower
		CRC data	Lower
			Upper

#### \* Arrangement of read-out word data

## (2) Function explanations

Word data of continuous word numbers from the read-out start No. can be read. Read-out word data are transmitted from the slave station in the order of upper and lower bytes.

---

### (3) Message transmission (example)

The following shows an example of reading out from No. 1 station the CH5 measurement concentration, decimal point position and measurement unit.

Relative address of CH5 measurement concentration: 000C<sub>H</sub> Data number: 03<sub>H</sub>

Command message composition (byte)

Station No.	01 <sub>H</sub>	
Function code	04 <sub>H</sub>	
Read-out start No. (relative address)	Upper	00 <sub>H</sub>
	Lower	0C <sub>H</sub>
Read-out word number	Upper	00 <sub>H</sub>
	Lower	03 <sub>H</sub>
CRC data	Lower	70 <sub>H</sub>
	Upper	08 <sub>H</sub>

Response message composition (byte)

Station No.	01 <sub>H</sub>	
Function code	04 <sub>H</sub>	
Read-out byte number	06 <sub>H</sub>	
Contents of the first word data	Upper	04 <sub>H</sub>
	Lower	B0 <sub>H</sub>
Next word data contents	Upper	00 <sub>H</sub>
	Lower	02 <sub>H</sub>
Latest word data contents	Upper	00 <sub>H</sub>
	Lower	00 <sub>H</sub>
CRC data	Lower	81 <sub>H</sub>
	Upper	0D <sub>H</sub>

\* Meaning of read-out data

First word data contents      04    B0<sub>H</sub> = 1200

Next word data contents      00    02<sub>H</sub> = 2 (decimal point position)

Latest word data contents      00    00<sub>H</sub> = 0 (vol %)

In the above case, measurement concentration = 12.00 vol%

➤Point➤ For handling of decimal point and unit, refer to Section 7.1.

## 6.3 Write-in of word data (1 word) [Function code:06<sub>H</sub>]

Function code	Max. word number write-in in one message	Relative data address	Register No.
06 <sub>H</sub>	1 word	0000 <sub>H</sub> –004C <sub>H</sub>	40001–40077
		07D0 <sub>H</sub> –07E0 <sub>H</sub>	42001–42017

### (1) Message composition

Command message composition (byte)

Station No.	
Function code	
Write-in designate No. (relative address)	Upper
	Lower
Write-in word data	Upper
	Lower
CRC data	Lower
	Upper

Response message composition (byte)

Station No.	
Function code	
Write-in designate No. (relative address)	Upper
	Lower
Write-in word data	Upper
	Lower
CRC data	Lower
	Upper

### (2) Function explanation

Designated word data is written in write-in designate No. Write-in data are transmitted from master station in the order of upper and lower bytes.

### (3) Message transmission (example)

The following shows an example of transmitting the “Brightness UP” key command to No.1 station.

Key operation command    Relative address: 07D0<sub>H</sub>

Command message composition (byte)

Station No.	01 <sub>H</sub>
Function code	06 <sub>H</sub>
Write-in designate No. (relative address)	Upper      07 <sub>H</sub>
	Lower      D0 <sub>H</sub>
Write-in word data	Upper      00 <sub>H</sub>
	Lower      40 <sub>H</sub>
CRC data	Lower      88 <sub>H</sub>
	Upper      B7 <sub>H</sub>

Response message composition (byte)

Station No.	01 <sub>H</sub>
Function code	06 <sub>H</sub>
Write-in designate No. (relative address)	Upper      07 <sub>H</sub>
	Lower      D0 <sub>H</sub>
Write-in word data	Upper      00 <sub>H</sub>
	Lower      40 <sub>H</sub>
CRC data	Lower      88 <sub>H</sub>
	Upper      B7 <sub>H</sub>

“Brightness UP” key command

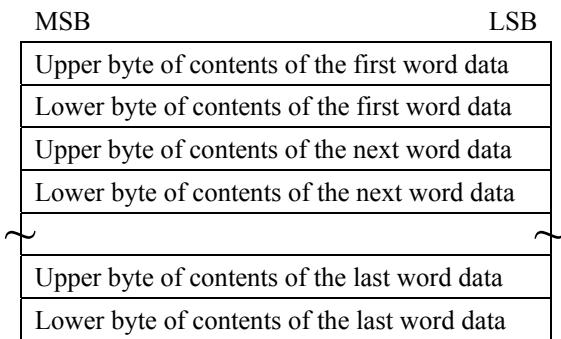

## 6.4 Write-in of continuous word data [Function code:10H]

Function code	Max. word number write-in in one message	Relative data address	Register No.
10 <sub>H</sub>	64 words	0000 <sub>H</sub> —004C <sub>H</sub>	40001—40077

## (1) Message composition

Command message composition (byte)		Response message composition (byte)	
Station No.		Station No.	
Function code		Function code	
Write-in start No. (relative address)	Upper	Write-in start No. (relative address)	Upper
	Lower		Lower
Write-in word number	Upper	Write-in word number	Upper
	Lower		Lower
Write-in byte number		{ Write-in word number × 2	
First write-in word data	Upper	CRC data	Lower
	Lower		Upper
Next write-in word data	Upper		
	Lower		
Last write-in word data		~	
CRC data	Upper		
	Lower		
	Upper		

\* Arrangement of write-in word data

## (2) Function explanation

Word data of continuous word number is written from write-in start address. Write-in word data are transmitted from master station in the order of upper and lower bytes.

## **7. ADDRESS MAP AND DATA FORMAT**

---

### **7.1 Data format**

#### **7.1.1 Transmission data format**

The MODBUS protocol used in this instrument is RTU (Remote Terminal Unit) mode. Transmitted data is "numeric value" and not ASCII code."

#### **7.1.2 Handling of decimal point position and measurement unit**

When transmitted, the calibration concentration setting, and measurement concentration data have no decimal point nor measurement unit.

Calculate exact values of data upon point positioning as shown below.

##### **(a) Calibration concentration setting (register No. 40001 to 40030)**

You can know the point position for each CH (channel) and each range, and unit upon reading in the decimal point position data (register No. 31036 to 31050), and the unit data (register No. 31006 to 31020).

The decimal point position data has a value of 0, 1, 2 or 3. You can obtain an exact value by the following calculation.

Case 0: Calibration concentration setting data /1

Case 1: Calibration concentration setting data /10

Case 2: Calibration concentration setting data /100

Case 3: Calibration concentration setting data /1000

The unit data has a value of 0, 1, 2 or 3, that corresponds as follows.

Case 0: vol%

Case 1: ppm

Case 2: mg/m<sup>3</sup>

Case 3: g/m<sup>3</sup>

For example, if:

CH1 range-1 span calibration concentration setting (register No. 40002) = 5000,

CH1 range-1 decimal point position (register No. 31036) = 1, and

CH1 range-1 unit (register No. 31006) = 1,

the value is 500.0 ppm.

For writing-in, proceed in the reverse. To obtain 500.0 ppm, write 5000 as calibration concentration setting.

The decimal point position and unit are unchangeable because fixed to each CH and each range.

- 
- (b) Measurement concentration (register No. 30001 to 30024)

The decimal point position and measurement unit for each concentration are stored in registers following that of concentration, and can be known by reading them in.

The meaning of decimal point position data and measurement unit data values are the same as in (a) above.

For example, if:

CH3 measurement concentration (register No. 30007) = 1270,

CH3 decimal point position (register No. 30008) = 2,

CH3 measurement unit (register No. 30009) = 0,

the value is 12.70 vol%

### **7.1.3 Handling at measurement data over-range**

Even if the measurement data is at over-range, with "----" displayed on the screen, the concentration that stands then is transmitted as read-out measurement concentration.

## 7.2 Address map

For details of functions and settable ranges of different parameters, refer to the instruction manual for the analyzer.

### Word data [read-out/write-in]: Function code [**03<sub>H</sub>**, **06<sub>H</sub>**, **10<sub>H</sub>**]

	Relative address	Register No.	Data type	Memory contents	Read-out/write-in data	Set item	Remarks	Type
Menu mode	0000 <sub>H</sub>	40001	Word	CH1 range-1 zero calibration concentration	0 to 9999 Decimal point position depends on range	1. Zero/span calibration “Calibration concentration value”	Note 1	F/S

Note 2) Analyzer type F/S stands for; F = ZSVF type, S = ZSVS type. When data of either F or S is displayed alone, the other analyzer would not be used.

Note 3) For details of \*1 and \*2, please refer to section “7.3 Supplement” to address map.

## 7.3 Supplement to address map

- \*1 Register No. 40031 (calibration component selection)

The following table shows the correspondence between the selected components and the gases represented by them.

1) ZSVF

Wet Air, Dry	Zero gas containing moisture (atmosphere), Span gas not containing moisture
Wet N <sub>2</sub> , Dry	Zero gas containing moisture (N <sub>2</sub> gas), Span gas not containing moisture

2) ZSVS

Air	Zero gas (atmosphere), Span gas
Dry N <sub>2</sub>	Calibration gas not containing moisture. Zero gas (N <sub>2</sub> gas), Span gas

- \*2 Register No. 40071 to 40074 (Response time 1 to 4)

40075 (Response time O<sub>2</sub> meter)

The following table lists the signals corresponding to respond time 1 to 4 and O<sub>2</sub> meter.

Response time 1	1st component detector signal
Response time 2	2nd component detector signal
Response time 3	3rd component detector signal
Response time 4	4th component detector signal
Response time O <sub>2</sub>	O <sub>2</sub> sensor signal

## 8. SAMPLE PROGRAM

---

This chapter concerns data read-out/write-in sample program which operates on N88-Japanese BASIC (\*2) for PC-9801 (\*1) or compatible PCs.

Note that the program shown here is for reference for you to create a program and not for guaranteeing all actions.

Before executing the program, make sure of the communication conditions in the following procedure.

- Communication speed (baud rate):

Match the conditions with this instrument using SWITCH command and SPEED command of MS-DOS (\*3).

For SWITCH command and SPEED command, refer to the reference manual of MS-DOS.

- Data length, stop bits and parity:

Set in this program. Match the conditions with this instrument.

\*1 PC-9801 series are products of NEC Corporation.

\*2 N88-Japanese BASIC is a registered trade mark of NEC Corporation.

\*3 MS-DOS is a registered trade mark of Microsoft Corporation.

---

### (a) Example of data read-out

Operation: Read-out CH1 measurement concentration value.  
(Continuous word read-out from read-out only area)

Used function code : 04H

Read-out start register No. : 30001

Read-out word number : 3

## **9. TROUBLESHOOTING**

---

If the communication is unavailable, check the following items.

- Whether all devices related to communication are turned on.
- Whether connections are correct.
- Whether the number of connected instruments and connection distance are as specified
- Whether communication conditions coincide between the master station (host computer) and slave stations (instrument)
  - Transmission speed : 9600bps
  - Data length : 8 bits
  - Stop bit : 1 bit
  - Parity : None
- Whether send/receive signal timing conforms to Section 5.6 in this manual.
- Whether the station No. designated as send destination by the master station coincides with the station No. of the connected instrument.
- Whether more than one instrument connected on the same transmission line shares the same station No.

---
